

Package ‘geosimilarity’

November 8, 2022

Type Package

Title Geographically Optimal Similarity

Date 2022-11-08

Version 2.2

Maintainer Yongze Song <yongze.song@outlook.com>

Description Understanding spatial association is essential for spatial statistical inference, including factor exploration and spatial prediction. Geographically optimal similarity (GOS) model is an effective method for spatial prediction, as described in Yongze Song (2022) [doi:10.1007/s11004-022-10036-8](https://doi.org/10.1007/s11004-022-10036-8). GOS was developed based on the geographical similarity principle, as described in Axing Zhu (2018) [doi:10.1080/19475683.2018.1534890](https://doi.org/10.1080/19475683.2018.1534890). GOS has advantages in more accurate spatial prediction using fewer samples and critically reduced prediction uncertainty.

bestkappa	<i>Function for the best kappa parameter</i>
-----------	--

Description

Function for determining the best kappa parameter for the optimal similarity

Usage

```
bestkappa(formula, data = data, kappa = seq(0.05,1,0.05), nrepeat = 10)
```

Arguments

formula	A formula of GOS model
data	A data.frame of observation data
kappa	A numeric vector of the optional percentages of observation locations with high similarity to a prediction location. kappa = 1 - tau, where tau is the probability parameter in quantile operator. kappa = 0.25 means that 25 location are used for modelling.
nrepeat	A numeric value of the number of cross-validation training times. The default value is 10.

Value

A list of the result of the best kappa and the computation process.

Examples

```
data("zn")
# log-transformation
hist(zn$Zn)
zn$Zn <- log(zn$Zn)
hist(zn$Zn)
# remove outliers
require(SecDim)
k <- rmvoutlier(zn$Zn, coef = 2.5)
dt <- zn[-k,]
# determine the best kappa
system.time({
b1 <- bestkappa(Zn ~ Slope + Water + NDVI + SOC + pH + Road + Mine,
```

```

    data = dt,
    kappa = c(0.01, 0.1, 1),
    nrepeat = 1)
})
b1$bestkappa
b1$plot

```

gos

*Geographically optimal similarity***Description**

Function for geographically optimal similarity (GOS) model

Usage

```
gos(formula, data = NULL, newdata = NULL, kappa = 0.25)
```

Arguments

formula	A formula of GOS model
data	A data.frame of observation data
newdata	A data.frame of prediction variables data
kappa	A numeric value of the percentage of observation locations with high similarity to a prediction location. kappa = 1 - tau, where tau is the probability parameter in quantile operator. The default kappa is 0.25, meaning that 25 location are used for modelling.

Value

A list of predictions and uncertainties.

Examples

```

data("zn")
# log-transformation
hist(zn$Zn)
zn$Zn <- log(zn$Zn)
hist(zn$Zn)
# remove outliers
require(SecDim)
k <- rmvoutlier(zn$Zn, coef = 2.5)
dt <- zn[-k,]
# split data for validation: 70% training; 30% testing
split <- sample(1:nrow(dt), round(nrow(dt)*0.7))
train <- dt[split,]
test <- dt[-split,]

```

```

system.time({ # 0.33s
g1 <- gos(Zn ~ Slope + Water + NDVI + SOC + pH + Road + Mine,
           data = train, newdata = test, kappa = 0.25)
})
test$pred <- g1$pred
plot(test$Zn, test$pred)
cor(test$Zn, test$pred)

```

grid *Spatial grid data of explanatory variables.*

Description

Spatial grid data of explanatory variables.

Usage

```
grid
```

Format

grid: A data frame of grided trace element explanatory variables with 13132 rows and 12 variables, where the first column is ID.

Author(s)

Yongze Song <yongze.song@curtin.edu.au>

zn *Spatial datasets of trace element Zn.*

Description

Spatial datasets of trace element Zn.

Usage

```
zn
```

Format

zn: A data frame of trace element Zn with 894 rows and 12 variables
