Date 2024-01-23
Title Incomplete Block Designs
Author B N Mandal [aut, cre]
Maintainer B N Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)
Depends R (>= 3.1.1)
Imports lpSolve, car, emmeans, multcomp
Suggests multcompView
Description A collection of several utility functions related to binary incomplete block designs. Contains function to generate A- and D-efficient binary incomplete block designs with given numbers of treatments, number of blocks and block size. Contains function to generate an incomplete block design with specified concurrence matrix. There are functions to generate balanced treatment incomplete block designs and incomplete block designs for test versus control treatments comparisons with specified concurrence matrix. Allows performing analysis of variance of data and computing estimated marginal means of factors from experiments using a connected incomplete block design. Tests of hypothesis of treatment contrasts in incomplete block design set up is supported.

Analysis of Variance, Estimated Marginal Means and Contrast Analysis of Data from An Incomplete Block Design

## Description

Performs intrablock analysis of variance of data from experiments using a block design. It also computes estimated marginal means of the factor variables (e.g. treatments) and optionally estimates and tests the contrasts of factor variables (e.g treatments).

## Usage

aov.ibd(formula, specs, data, contrast, joint=FALSE, details=FALSE, sort=TRUE, by=NULL, alpha=0.05,Letters = "ABCDEFGHIJ", ...)

## Arguments

| formula | A formula specifying the model of the form response~treatment+block or re- <br> sponse~block+treatment. Make sure the treatment and blocks are factor vari- <br> ables. |
| :--- | :--- |
| specs | A character vector specifying the names of the factors over which estimated <br> marginal means are desired |
| data | A data frame in which the variables specified in the formula will be found. If <br> missing, the variables are searched for in the standard way. |
| contrast | A matrix whose rows are contrasts of factors (e.g. treatments) |
| joint | If contrast argument has more than one row, then whether a joint test of the con- <br> trasts will be performed. Default is FALSE. If joint=TRUE, a check is performed <br> whether the contrasts are pairwise orthogonal or not and then if orthoghonal, <br> joint test is performed. |
| details | Logical, if details=TRUE then all objects including lm object from lm(), emm- <br> Grid object from emmeans() are returned. Default is FALSE. |
| sort | Logical value determining whether the least square means are sorted before the <br> comparisons are produced. Default is TRUE. |

by $\quad$ Character value giving the name or names of variables by which separate families of comparisons are tested. If NULL, all means are compared.
alpha Numeric value giving the significance level for the comparisons
Letters Characters to be used for compact letter display of groups of factor variables over which least square means are computed. Default is english alphabet capital letters "ABCDEFGHIJ"
... Not used

## Details

The function makes use of $\operatorname{lm}()$ function in $R$ and Anova() function in car package with specification of Type III sum of squares and emmeans(), contrast() functions in emmeans() package, cld() function in multcomp package and combines the results in a single place.

## Value

Returns a list with following components

| lm.obj | An object of class lm if details=TRUE |
| :--- | :--- |
| ANOVA.table | ANOVA table from the fitted lm object |
| EMMEANS | Estimated marginal means means with compact letter display |
| contrast.analysis |  |
|  | Contrast analysis result if contrast matrix was supplied |

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
data(ibddata)
aov.ibd(y~factor(trt)+factor(blk),data=ibddata)
contrast=matrix(c(1,-1,0,0,0,0,0,0,0,0,0,1,-1,0,0,0,0,0),nrow=2,byrow=TRUE)
aov.ibd(y~factor(trt)+factor(blk),specs="trt",data=ibddata,contrast=contrast)
```

A_eff A-efficiency of A Binary Incomplete Block Design

## Description

Computes lower bound to A-efficiency of a binary incomplete block design. Treatment by block incidence matrix of the design is to be supplied as input to the function.

## Usage

A_eff(N)

## Arguments

$N \quad$ Treatment by block incidence matrix

## Value

Aeff A-efficiency

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
N=matrix(c(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0,0,0,1,0,0,
1,0,1,1,0,0),nrow=7, byrow=TRUE)
A_eff(N)
```

## bibd

Balanced Incomplete Block Design for Given Parameters

## Description

Generates a balanced incomplete block design with given number of treaments (v), number of blocks (b), number of replications (r), block size (k) and number of concurrences (lambda).

## Usage

bibd(v,b,r,k,lambda,ntrial=5, pbar=FALSE)

## Arguments

v
number of treatments
b
number of blocks
$r$ number of replications
k block size
lambda number of concurrences
ntrial number of trials. Default value is 5.
pbar logical value indicating whether progress bar will be displayed or not. Default is FALSE

## Value

v
number of treatments
b number of blocks number of replications
k
block size
lambda number of concurrences
design block contents in a b by k matrix
$\mathrm{N} \quad$ treatments by blocks incidence matrix of the generated design
NNP concurrence matrix of the generated design
Aeff Lower bound to the A-efficiency of the generated design
Deff Lower bound to the D-efficiency of the generated design

## Note

The function works best for values of number of treatments (v) up to 30 and block size (k) up to 10 . However, for block size (k) up to 3, much larger values of number of treatments (v) may be used.

& \operatorname{bibd}(7,7,3,3,1) \\
& \operatorname{bibd}(9,12,4,3,1)
\end{aligned}
$$

```
btib Balanced Treatment Incomplete Block Designs
```

## Description

Generates a balanced treatment incomplete block design for specified parameters.

## Usage

btib(v,b,r,r0,k,lambda,lambda0,ntrial=5, pbar=FALSE)

## Arguments

$v$ number of test treatments
b number of blocks
$r \quad$ number of replications of test treatments
r0 number of replications of the control treatment
k block size
lambda number of concurrences among test treatments
lambda0 number of concurrences between test treatments and the control treatment
ntrial number of trials. Default is 5.
pbar logical value indicating whether progress bar will be displayed or not. Default is FALSE.

## Value

v number of test treatments
b number of blocks
$r$ number of replications of test treatments
r0 number of replications of the control treatment
k block size
lambda number of concurrences among test treatments
lambda0 number of concurrences between test treatments and the control treatment
design generated block design
$\mathrm{N} \quad$ treatment by block incidence matrix of the generated block design
NNP concurrence matrix of the generated design
Aeff A-efficiency of the generated design

## Note

The function works best for values of number of treatments (v) up to 30 and block size (k) up to 10 . However, for block size ( $k$ ) up to 3, much larger values of number of treatments (v) may be used.

## Examples

$\operatorname{btib}(4,6,3,6,3,1,3,10)$

## btib1 Balanced Treatment Incomplete Block Designs

## Description

Generates a balanced treatment incomplete block design for specified parameters by searching all possible combinations.

## Usage

btib1(v, b, r, r0, k, lambda, lambda0)

## Arguments

| v | number of test treatments |
| :--- | :--- |
| b | number of blocks |
| r | number of replications of test treatments |
| r 0 | number of replications of the control treatment |
| k | block size |
| lambda | number of concurrences among test treatments |
| lambda0 | number of concurrences between test treatments and control treatment |

| Value |  |
| :---: | :--- |
| v | number of test treatments |
| $b$ | number of blocks |
| r | number of replications of test treatments |
| r0 | number of replications of control treatment |
| k | block size |

| lambda | number of concurrences among test treatments |
| :--- | :--- |
| lambda0 | number of concurrences between test treatments and control treatment |
| design | generated block design |
| N | treatment by block incidence matrix of the generated block design |
| NNP | concurrence matrix of the generated design |
| Aeff | A-efficiency of the generated design |

## Note

The function works best for values of number of treatments (v) up to 30 and block size (k) up to 10 . However, for block size (k) up to 3, much larger values of number of treatments (v) may be used.

## Examples

btib $(4,6,3,6,3,1,3)$
Cmatrix Information Matrix of a Block Design

## Description

Gives the information matrix from a given treatment by block incidence matrix of a block design

## Usage

Cmatrix(N)

## Arguments

N
treatment by block incidence matrix

## Value

Cmatrix $\quad v$ by $v$ information matrix where $v$ is number of treatments

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
N = matrix(c(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0,0,0,1,0,0
,1,0,1,1,0,0),nrow=7,byrow=TRUE)
Cmatrix(N)
Information.Matrix(N)
```

design_to_N Block Design to Treatment by Block Incidence Matrix

## Description

Generates treatment by block incidence matrix from a given block design

## Usage

design_to_N(design)
$N$ (design)

## Arguments

```
    design design
```

## Value

$\mathrm{N} \quad$ A treatment by block incidence matrix of order v by b with elements as 0 and 1 where $v$ is the number of treatments and $b$ is the number of blocks

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
design = matrix(c(1,4,6,5,6,7,3,4,5,2,4,7,1,3,7,2,3,6,1,2,5),nrow=7,byrow=TRUE)
design_to_N(design)
# or alternatively
N(design)
```

D_eff D-efficiency of a Binary Incomplete Block Design

## Description

Computes lower bound to D-efficiency of a binary incomplete block design

## Usage

D_eff(N)

## Arguments

$\mathrm{N} \quad$ treatment by block incidence matrix

## Value

Deff lower bound to D-efficiency

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
N=matrix(c(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0,0,0,1,0,0
    ,1,0,1,1,0,0),nrow=7,byrow=TRUE)
    D_eff(N)
```

Binary Incomplete Block Design for Given v, b and $k$ and Optionally, with a Specified Concurrence Matrix

## Description

Generates an A- and D- efficient binary incomplete block design with given number of treaments(v), number of blocks(b) and block size(k) and optionally with a specified concurrence matrix(NNP).

## Usage

ibd(v,b,k,NNPo,ntrial=5, pbar=FALSE)

## Arguments

| v | number of treatments |
| :--- | :--- |
| b | number of blocks |
| k | block size |
| NNPo | optionally, desired concurrence matrix. If not specified, a nearly balanced con- <br> currence matrix is obtained automatically. |
| ntrial | number of trials. Default is 5. |
| pbar | progress bar. Default is FALSE. |

## Value

v number of treatments
b number of blocks
k block size
NNP specified concurrence matrix
$\mathrm{N} \quad$ incidence matrix of the generated design
design block contents in ab by k matrix
conc.mat concurrence matrix of the generated design
A.efficiency lower bound to A-efficiency of the generated design
D.efficiency lower bound to D-efficiency of the generated design
time.taken time taken to generate the design

## Note

This function works best for values of number of treatments (v) up to 30 and block size (k) up to 10 . However, for block size (k) up to 3, much larger values of number of treatments (v) may be used.

## Examples

```
ibd(v = 7,b = 7,k = 4, pbar=FALSE)
```

## Description

Data from an experiment using incomplete block design

## Usage

data("ibddata")

## Format

A data frame with 36 observations on the following 3 variables.
trt Treatments
blk Blocks
y The response variable

## Details

The experiment used a balanced incomplete block design.

3,3,3,3,3,3,3,3,7,3,3,3,3,3,3,3,3,9,9,3,3,3,3,3,3,9,9),nrow=8, byrow=TRUE)
ibdtvc(6, 2, 15,4,NNPo)
```

## Description

Checks whether an incomplete block design is connected or not. Treatment by block incidence matrix of the design is to be supplied as input to the function. If the design is connected, it returns a value of 1 else it returns 0 .

## Usage

is.connected( N )

## Arguments

$\mathrm{N} \quad$ incidence matrix

## Value

connected connctedness

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

$\mathrm{N}=$ matrix $(\mathrm{c}(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0$, $0,0,1,0,0,1,0,1,1,0,0)$, nrow=7, byrow=TRUE)
is.connected(N)
is.equir Equi-replicateness a Binary Incomplete Block Design

## Description

Checks whether an incomplete block design is equi-replicated or not. Treatment by block incidence matrix of the design is to be supplied as input to the function. If the design is equir-eplicated, it returns a value of 1 else it returns 0 .

## Usage

is.equir ( $N$ )

## Arguments

N
incidence matrix

## Value

equir equi-replicated

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
N=matrix(c(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0,
0,0,1,0,0,1,0,1,1,0,0),nrow=7, byrow=TRUE)
is.equir(N)
```

is.orthogonal Orthogonality a Block Design

## Description

Checks whether an incomplete block design is orthogonal or not. Treatment by block incidence matrix of the design is to be supplied as input to the function. If the design is orthogonal, it returns a value of 1 else it returns 0 .

## Usage

is.orthogonal(N)

## Arguments

$\mathrm{N} \quad$ incidence matrix

## Value

orthogonal orthogonal

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
N=matrix(c(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0,
0,0,1,0,0,1,0,1,1,0,0),nrow=7, byrow=TRUE)
is.orthogonal(N)
```

## Description

Checks whether an incomplete block design is proper or not. Treatment by block incidence matrix of the design is to be supplied as input to the function. If the design is proper, it returns a value of 1 else it returns 0 .

## Usage

is. $\operatorname{proper}(\mathrm{N})$

## Arguments

$\mathrm{N} \quad$ incidence matrix

## Value

proper proper

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

$\mathrm{N}=$ matrix $(\mathrm{c}(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0$, $0,0,1,0,0,1,0,1,1,0,0)$, nrow=7, byrow=TRUE)
is.proper ( N )
is.vb Variance Balancedness of a Binary Incomplete Block Design

## Description

Checks whether an incomplete block design is variance balanced or not. Treatment by block incidence matrix of the design is to be supplied as input to the function. If the design is variance balanced, it returns a value of 1 else it returns 0 .

## Usage

is. $\mathrm{vb}(\mathrm{N})$

## Arguments

N
incidence matrix

## Value

$\mathrm{vb} \quad$ variance balanced

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

$\mathrm{N}=$ matrix $(\mathrm{c}(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,1,1,0$, $0,0,1,0,0,1,0,1,1,0,0)$, nrow=7, byrow=TRUE)
is. $\mathrm{vb}(\mathrm{N})$

## Description

Generates the block contents from a given treatment by block incidence matrix

## Usage

N_to_design(N)
design(N)

## Arguments

$\mathrm{N} \quad$ treatment by block incidence matrix

## Value

design a matrix with number of rows equal to number of blocks and number of columns equal to block size. Constant block size is assumed. Treatments are labelled as $1,2, \ldots, \mathrm{v}$.

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

```
N=matrix(c(1,0,0,0,1,0,1,0,0,0,1,0,1,1,0,0,1,0,1,1,0,1,0,1,1,0,0,0,0,1,1,0,0,0,1,
1,1,0,0,0,1,0,0,1,0,1,1,0,0),nrow=7,byrow=TRUE)
N_to_design(N)
design(N)
```

randomize Randomize a block design

## Description

Randomize a given block design

## Usage

randomize(design)

## Arguments

design design

## Value

design $\quad$ Block design with a constant block size

## Author(s)

Baidya Nath Mandal [mandal.stat@gmail.com](mailto:mandal.stat@gmail.com)

## Examples

design $=$ matrix $(c(1,4,6,5,6,7,3,4,5,2,4,7,1,3,7,2,3,6,1,2,5)$, nrow=7, byrow=TRUE $)$
randomize(design)
