

# Package ‘tramvs’

March 10, 2023

**Type** Package

**Title** Optimal Subset Selection for Transformation Models

**Version** 0.0-4

**Description** Greedy optimal subset selection for transformation models

(Hothorn et al., 2018, <[doi:10.1111/sjos.12291](https://doi.org/10.1111/sjos.12291)> ) based on the abess algorithm (Zhu et al., 2020, <[doi:10.1073/pnas.2014241117](https://doi.org/10.1073/pnas.2014241117)> ). Applicable to models from packages ‘tram’ and ‘cotram’.

**Depends** R (>= 4.0), tram (>= 0.6-1)

**Imports** stats, variables, methods, cotram

**Suggests** abess, tramnet, colorspace, knitr, mlt, TH.data, survival, ordinal

**License** GPL-3

**Encoding** UTF-8

**RoxygenNote** 7.1.2

**URL** <http://ctm.R-forge.R-project.org>

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Lucas Kook [aut, cre],  
Sandra Siegfried [ctb],  
Torsten Hothorn [ctb]

**Maintainer** Lucas Kook <[lucasheinrich.kook@uzh.ch](mailto:lucasheinrich.kook@uzh.ch)>

**Repository** CRAN

**Date/Publication** 2023-03-10 14:20:02 UTC

abess\_tram*Optimal subset selection for transformation models*

---

**Description**

Optimal subset selection for transformation models

**Usage**

```
abess_tram(
  formula,
  data,
  modFUN,
  supp,
  mandatory = NULL,
  k_max = supp,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  m0 = NULL,
  ...
)
```

## Arguments

<code>formula</code>	object of class "formula".
<code>data</code>	data frame containing the variables in the model.
<code>modFUN</code>	function for fitting a transformation model, e.g., <code>BoxCox()</code> .
<code>supp</code>	support size of the coefficient vector
<code>mandatory</code>	formula of mandatory covariates, which will always be included and estimated in the model. Note that this also changes the initialization of the active set. The active set is then computed with regards to the model residuals of <code>modFUN(mandatory, ...)</code> instead of the unconditional model.
<code>k_max</code>	maximum support size to consider during the splicing algorithm. Defaults to <code>supp</code> .
<code>thresh</code>	threshold when to stop splicing. Defaults to $0.01 * supp * p * \log(\log(n)) / n$ , where $p$ denotes the number of predictors and $n$ the sample size.
<code>init</code>	initialize active set. Defaults to <code>TRUE</code> and initializes the active set with those covariates that are most correlated with score residuals of an unconditional <code>modFUN(update(formula, . ~ 1))</code> .
<code>m_max</code>	maximum number of iterating the splicing algorithm.
<code>m0</code>	Transformation model for initialization
<code>...</code>	additional arguments supplied to <code>modFUN</code> .

## Value

List containing the fitted model via `modFUN`, active set  $A$  and inactive set  $I$ .

## Examples

```
set.seed(24101968)
library(tramvs)

N <- 1e2
P <- 5
nz <- 3
beta <- rep(c(1, 0), c(nz, P - nz))
X <- matrix(rnorm(N * P), nrow = N, ncol = P)
Y <- 1 + X %*% beta + rnorm(N)

dat <- data.frame(y = Y, x = X)

abess_tram(y ~ ., dat, modFUN = Lm, supp = 3)
```

AIC.tramvs                    *AIC "tramvs"*

### Description

`AIC "tramvs"`

### Usage

```
## S3 method for class 'tramvs'
AIC(object, ...)
```

### Arguments

<code>object</code>	object of class "tramvs"
...	additional arguments to <code>AIC()</code>

### Value

Numeric vector containing AIC of best model

BoxCoxVS                    *Optimal subset selection in a BoxCox-type transformation model*

### Description

Optimal subset selection in a BoxCox-type transformation model

### Usage

```
BoxCoxVS(
  formula,
  data,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  ...
)
```

**Arguments**

formula	object of class "formula".
data	data frame containing the variables in the model.
supp_max	maximum support which to call abess_tram with.
k_max	maximum support size to consider during the splicing algorithm. Defaults to supp.
thresh	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where p denotes the number of predictors and n the sample size.
init	initialize active set. Defaults to TRUE and initializes the active set with those covariates that are most correlated with score residuals of an unconditional modFUN(update(formula, . ~ 1)).
m_max	maximum number of iterating the splicing algorithm.
...	Additional arguments supplied to <a href="#">BoxCox</a>

**Value**

See [tramvs](#)

coef.abess\_tram      *Coef "abess\_tram"*

**Description**

Coef "abess\_tram"

**Usage**

```
## S3 method for class 'abess_tram'
coef(object, ...)
```

**Arguments**

object	object of class "tramvs"
...	additional arguments to coef()

**Value**

Named numeric vector containing coefficient estimates see [coef.tram](#)

`coef.tramvs`      *Coef "tramvs"*

### Description

`Coef "tramvs"`

### Usage

```
## S3 method for class 'tramvs'
coef(object, best_only = FALSE, ...)
```

### Arguments

<code>object</code>	Object of class "tramvs"
<code>best_only</code>	Whether to return the coefficients of the best model only (default: FALSE)
<code>...</code>	additional arguments to <code>coef()</code>

### Value

Vector (`best_only = TRUE`) or matrix (`best_only = FALSE`) of coefficients

`ColrVS`      *Optimal subset selection in a Colr-type transformation model*

### Description

Optimal subset selection in a Colr-type transformation model

### Usage

```
ColrVS(
  formula,
  data,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  ...
)
```

**Arguments**

formula	object of class "formula".
data	data frame containing the variables in the model.
supp_max	maximum support which to call abess_tram with.
k_max	maximum support size to consider during the splicing algorithm. Defaults to supp.
thresh	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where p denotes the number of predictors and n the sample size.
init	initialize active set. Defaults to TRUE and initializes the active set with those covariates that are most correlated with score residuals of an unconditional modFUN(update(formula, . ~ 1)).
m_max	maximum number of iterating the splicing algorithm.
...	Additional arguments supplied to <a href="#">Colr</a>

**Value**

See [tramvs](#)

cor\_init

*Compute correlation for initializing the active set*

**Description**

Compute correlation for initializing the active set

**Usage**

```
cor_init(m0, mb)
```

**Arguments**

m0	modFUN(formula, data)
mb	modFUN(mandatory, data)

**Value**

Vector of correlations for initializing the active set, depends on type of model (see e.g. [cor\\_init.default](#))

`cor_init.default`      *Default method for computing correlation*

### Description

Default method for computing correlation

### Usage

```
## Default S3 method:  
cor_init(m0, mb)
```

### Arguments

<code>m0</code>	<code>modFUN(formula, data)</code>
<code>mb</code>	<code>modFUN(mandatory, data)</code>

### Value

Vector of correlation for initializing the active set

`cor_init.stram`      *Shift-scale tram method for computing correlation*

### Description

Shift-scale tram method for computing correlation

### Usage

```
## S3 method for class 'stram'  
cor_init(m0, mb)
```

### Arguments

<code>m0</code>	<code>modFUN(formula, data)</code>
<code>mb</code>	<code>modFUN(mandatory, data)</code>

### Value

Vector of correlations for initializing the active set, includes both shift and scale residuals

---

**cotramVS***Optimal subset selection in a cotram model*

---

**Description**

Optimal subset selection in a cotram model

**Usage**

```
cotramVS(  
  formula,  
  data,  
  supp_max = NULL,  
  k_max = NULL,  
  thresh = NULL,  
  init = TRUE,  
  m_max = 10,  
  ...  
)
```

**Arguments**

formula	object of class "formula".
data	data frame containing the variables in the model.
supp_max	maximum support which to call abess_tram with.
k_max	maximum support size to consider during the splicing algorithm. Defaults to supp.
thresh	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where p denotes the number of predictors and n the sample size.
init	initialize active set. Defaults to TRUE and initializes the active set with those covariates that are most correlated with score residuals of an unconditional modFUN(update(formula, . ~ 1)).
m_max	maximum number of iterating the splicing algorithm.
...	Additional arguments supplied to <a href="#">cotram</a>

**Value**

See [tramvs](#)

**Description**

Optimal subset selection in a Coxph-type transformation model

**Usage**

```
CoxphVS(
  formula,
  data,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  ...
)
```

**Arguments**

<code>formula</code>	object of class "formula".
<code>data</code>	data frame containing the variables in the model.
<code>supp_max</code>	maximum support which to call <code>abess_tram</code> with.
<code>k_max</code>	maximum support size to consider during the splicing algorithm. Defaults to <code>supp</code> .
<code>thresh</code>	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where $p$ denotes the number of predictors and $n$ the sample size.
<code>init</code>	initialize active set. Defaults to <code>TRUE</code> and initializes the active set with those covariates that are most correlated with score residuals of an unconditional <code>modFUN(update(formula, . ~ 1))</code> .
<code>m_max</code>	maximum number of iterating the splicing algorithm.
<code>...</code>	Additional arguments supplied to <code>Coxph</code>

**Value**

See [tramvs](#)

## Description

Optimal subset selection in a Lehmann-type transformation model

## Usage

```
LehmannVS(
  formula,
  data,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  ...
)
```

## Arguments

<code>formula</code>	object of class "formula".
<code>data</code>	data frame containing the variables in the model.
<code>supp_max</code>	maximum support which to call <code>abess_tram</code> with.
<code>k_max</code>	maximum support size to consider during the splicing algorithm. Defaults to <code>supp</code> .
<code>thresh</code>	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where $p$ denotes the number of predictors and $n$ the sample size.
<code>init</code>	initialize active set. Defaults to <code>TRUE</code> and initializes the active set with those covariates that are most correlated with score residuals of an unconditional <code>modFUN(update(formula, . ~ 1))</code> .
<code>m_max</code>	maximum number of iterating the splicing algorithm.
<code>...</code>	Additional arguments supplied to <code>Lehmann</code>

## Value

See [tramvs](#)

## Description

Optimal subset selection in an Lm-type transformation model

## Usage

```
LmVS(
  formula,
  data,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  ...
)
```

## Arguments

<code>formula</code>	object of class "formula".
<code>data</code>	data frame containing the variables in the model.
<code>supp_max</code>	maximum support which to call <code>abess_tram</code> with.
<code>k_max</code>	maximum support size to consider during the splicing algorithm. Defaults to <code>supp</code> .
<code>thresh</code>	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where $p$ denotes the number of predictors and $n$ the sample size.
<code>init</code>	initialize active set. Defaults to <code>TRUE</code> and initializes the active set with those covariates that are most correlated with score residuals of an unconditional <code>modFUN(update(formula, . ~ 1))</code> .
<code>m_max</code>	maximum number of iterating the splicing algorithm.
<code>...</code>	Additional arguments supplied to <a href="#">Lm</a>

## Value

See [tramvs](#)

---

logLik.tramvs      *logLik "tramvs"*

---

**Description**

logLik "tramvs"

**Usage**

```
## S3 method for class 'tramvs'  
logLik(object, ...)
```

**Arguments**

object	object of class "tramvs"
...	additional arguments to logLik()

**Value**

Numeric vector containing log-likelihood of best model, see [logLik.tram](#)

---

plot.tramvs      *Plot "tramvs" object*

---

**Description**

Plot "tramvs" object

**Usage**

```
## S3 method for class 'tramvs'  
plot(x, which = c("tune", "path"), ...)
```

**Arguments**

x	object of class "tramvs"
which	plotting either the regularization path ("path") or the information criterion against the support size ("tune", default)
...	additional arguments to plot()

**Value**

Returns invisible(NULL)

## Description

Optimal subset selection in a Polr-type transformation model

## Usage

```
PolrVS(
  formula,
  data,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  ...
)
```

## Arguments

<code>formula</code>	object of class "formula".
<code>data</code>	data frame containing the variables in the model.
<code>supp_max</code>	maximum support which to call <code>abess_tram</code> with.
<code>k_max</code>	maximum support size to consider during the splicing algorithm. Defaults to <code>supp</code> .
<code>thresh</code>	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where $p$ denotes the number of predictors and $n$ the sample size.
<code>init</code>	initialize active set. Defaults to <code>TRUE</code> and initializes the active set with those covariates that are most correlated with score residuals of an unconditional <code>modFUN(update(formula, . ~ 1))</code> .
<code>m_max</code>	maximum number of iterating the splicing algorithm.
<code>...</code>	Additional arguments supplied to <code>Polr</code>

## Value

See [tramvs](#)

---

predict.tramvs	<i>Predict "tramvs"</i>
----------------	-------------------------

---

**Description**

Predict "tramvs"

**Usage**

```
## S3 method for class 'tramvs'  
predict(object, ...)
```

**Arguments**

object	object of class "tramvs"
...	additional arguments to predict.tram()

**Value**

See [predict.tram](#)

---

print.tramvs	<i>Print "tramvs"</i>
--------------	-----------------------

---

**Description**

Print "tramvs"

**Usage**

```
## S3 method for class 'tramvs'  
print(x, ...)
```

**Arguments**

x	object of class "tramvs"
...	ignored

**Value**

"tramvs" object is returned invisibly

`residuals.tramvs`      *Residuals "tramvs"*

### Description

Residuals "tramvs"

### Usage

```
## S3 method for class 'tramvs'
residuals(object, ...)
```

### Arguments

object	object of class "tramvs"
...	additional arguments to <code>residuals()</code>

### Value

Numeric vector containing residuals of best model, see `residuals.tram`

`SIC`      *SIC generic*

### Description

SIC generic

### Usage

```
SIC(object, ...)
```

### Arguments

object	Model to compute SIC from
...	for methods compatibility only

### Value

Numeric vector (`best_only = TRUE`) or data.frame with SIC values

SIC.tramvs

*SIC "tramvs"***Description**

SIC "tramvs"

**Usage**

```
## S3 method for class 'tramvs'
SIC(object, best_only = FALSE, ...)
```

**Arguments**

object	object of class "tramvs"
best_only	Wether to return the coefficients of the best model only (default: FALSE)
...	for methods compatibility only

**Value**

Numeric vector (best\_only = TRUE) or data.frame with SIC values

simulate.tramvs

*Simulate "tramvs"***Description**

Simulate "tramvs"

**Usage**

```
## S3 method for class 'tramvs'
simulate(object, nsim = 1, seed = NULL, ...)
```

**Arguments**

object	object of class "tramvs"
nsim	number of simulations
seed	random seed for simulation
...	additional arguments to simulate()

**Value**See [simulate.mlt](#)

---

summary.tramvs      *Summary "tramvs"*

---

**Description**

Summary "tramvs"

**Usage**

```
## S3 method for class 'tramvs'  
summary(object, ...)
```

**Arguments**

object	object of class "tramvs"
...	ignored

**Value**

"tramvs" object is returned invisibly

---

support.tramvs      *Support "tramvs"*

---

**Description**

Support "tramvs"

**Usage**

```
## S3 method for class 'tramvs'  
support(object, ...)
```

**Arguments**

object	object of class "tramvs"
...	ignored

**Value**

Character vector containing active set of best fit

---

SurvregVS*Optimal subset selection in a Survreg model*

---

**Description**

Optimal subset selection in a Survreg model

**Usage**

```
SurvregVS(
  formula,
  data,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  ...
)
```

**Arguments**

formula	object of class "formula".
data	data frame containing the variables in the model.
supp_max	maximum support which to call abess_tram with.
k_max	maximum support size to consider during the splicing algorithm. Defaults to supp.
thresh	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where p denotes the number of predictors and n the sample size.
init	initialize active set. Defaults to TRUE and initializes the active set with those covariates that are most correlated with score residuals of an unconditional modFUN(update(formula, . ~ 1)).
m_max	maximum number of iterating the splicing algorithm.
...	Additional arguments supplied to <a href="#">Survreg</a>

**Value**

See [tramvs](#)

---

**tramvs***Select optimal subset based on high dimensional BIC*

---

## Description

Select optimal subset based on high dimensional BIC

## Usage

```
tramvs(
  formula,
  data,
  modFUN,
  mandatory = NULL,
  supp_max = NULL,
  k_max = NULL,
  thresh = NULL,
  init = TRUE,
  m_max = 10,
  m0 = NULL,
  verbose = TRUE,
  ...
)
```

## Arguments

<code>formula</code>	object of class "formula".
<code>data</code>	data frame containing the variables in the model.
<code>modFUN</code>	function for fitting a transformation model, e.g., BoxCox().
<code>mandatory</code>	formula of mandatory covariates, which will always be included and estimated in the model. Note that this also changes the initialization of the active set. The active set is then computed with regards to the model residuals of <code>modFUN(mandatory, ...)</code> instead of the unconditional model.
<code>supp_max</code>	maximum support which to call abess_tram with.
<code>k_max</code>	maximum support size to consider during the splicing algorithm. Defaults to <code>supp</code> .
<code>thresh</code>	threshold when to stop splicing. Defaults to $0.01 * \text{supp} * p * \log(\log(n)) / n$ , where $p$ denotes the number of predictors and $n$ the sample size.
<code>init</code>	initialize active set. Defaults to <code>TRUE</code> and initializes the active set with those covariates that are most correlated with score residuals of an unconditional <code>modFUN(update(formula, . ~ 1))</code> .
<code>m_max</code>	maximum number of iterating the splicing algorithm.
<code>m0</code>	Transformation model for initialization
<code>verbose</code>	show progress bar (default: <code>TRUE</code> )
<code>...</code>	additional arguments supplied to <code>modFUN</code> .

**Details**

L0-penalized (i.e., best subset selection) transformation models using the abess algorithm.

**Value**

object of class "tramvs", containing the regularization path (information criterion SIC and coefficients coefs), the best fit (best\_fit) and all other models (all\_fits)

**Examples**

```
set.seed(24101968)
library(tramvs)

N <- 1e2
P <- 5
nz <- 3
beta <- rep(c(1, 0), c(nz, P - nz))
X <- matrix(rnorm(N * P), nrow = N, ncol = P)
Y <- 1 + X %*% beta + rnorm(N)

dat <- data.frame(y = Y, x = X)
res <- tramvs(y ~ ., data = dat, modFUN = Lm)
plot(res, type = "s")
plot(res, which = "path")
```
